Working in a SCRUM team of approximately ten people on an intranet application that combines many legacy SOA systems into a single portal (EAI project). This portal application is then used to automate correspondence with consumers.

My role so far has varied covering the following activities:

- Perform a migration from Websphere 7 to Tomcat 6, while maintaining backwards compatibility (being able to deploy the app to both platforms).
- Develop an approach to automated GUI testing (using fitness and selenium) in a continuous integration cycle
- Develop services and consuming services in a SOA landscape
- Implement front-to-end JSF GUI's that interact with many services and a backend.
